

## The International Bank for the Glomeromycota

(<http://i-beg.eu>)

### BEG INOCULUM

The donor of the inoculum BEG ..... declares that it contains spores and other propagules of the designated arbuscular mycorrhizal fungus. It is supplied with the proviso that it is for the user to initiate fresh cultures for scientific purposes only (please specify below). **It is not to be used commercially, sold or exchanged with other entities** without the agreement of either the donor or the IBG Committee. The material has been raised in pure open pot-culture but by the nature of this technique the substrate may be colonised by other microorganisms. The IBG and donor, therefore, accept no responsibility for the contents other than the AM fungus within the substrate. You should always acknowledge the use of a BEG culture in any publication resulting from the work.

If you accept these conditions please complete, sign and return to the curator :
